Diabetes Review: The 2 New Insulins on the Block

February 08, 2016
By Bradley Wright, PharmD [1]

Got a minute? Check out this concise review of the facts about long-acting insulin formulations Toujeo and Tresiba.

Two new long-acting insulin products were recently approved by the FDA. Toujeo (insulin glargine 300 units/mL) and Tresiba (insulin degludec 100 units/mL or 200 units/mL).

In clinical trials both were found comparable to Lantus (insulin glargine) and Levemir (insulin detemir [rDNA origin] injection), with regard to lowering A1c; both may also be associated with lower rates of nocturnal hypoglycemia.

Click through the 8 slides above for a quick review of more features of both.
